O'Hare International Airport North Air Traffic Control Tower Parking Lot

The NATCT and support building had separate sets of plans that included a separate parking lot for tower employees, a security entrance at the perimeter of the building, grading plans, a green roof system, connection to an existing gas line, a water main extension, and adding fire hydrants.

NATCT Parking Lot: The scope of the work involved replacing the existing parking lot where the NATCT was to be constructed. Delta Engineering Group, LLC prepared plans for an access road to the parking lot and tower, as well as site grading, utilities, and drainage plans. DEG analyzed the capacity of the existing drainage system to determine the impact of the proposed new system, and evaluated whether or not additional storage was required on site before discharging to the sewer system.
